

FITBUDDY

Project Demonstration Phase

AI-Powered Fitness & Wellness Assistant

Project Name	FitBuddy
Phase	Project Demonstration
Project Type	Web / Mobile-friendly Fitness Application
Domain	Fitness, Wellness & AI

1. Demonstration Objective

The objective of the FitBuddy demonstration is to show the working features of the application, explain the user flow, and demonstrate how the system provides fitness-related recommendations and tracks user activities.

2. Demonstration Flow

Open Application → Register / Login → Create Fitness Profile → Select Fitness Goal → View Recommended Workout → View Exercise Details → Record Workout → Check Progress Dashboard

3. Features to Demonstrate

- **Home Page:** Introduce FitBuddy and its main purpose.
- **User Registration/Login:** Demonstrate account access and validation.
- **Fitness Profile:** Enter fitness level, goal and preferences.
- **Workout Planner:** Show a suitable workout plan based on user inputs.
- **Exercise Guide:** Demonstrate exercise information and instructions.
- **Progress Tracker:** Record completed activities and display progress.
- **Dashboard:** Show goals, workouts and progress in one place.

4. Sample Demonstration Scenario

A new user opens FitBuddy and creates a profile. The user selects a fitness goal and provides basic activity information. FitBuddy processes the information and displays a suitable workout recommendation. The user views the exercise instructions, completes the workout and records the activity. The dashboard then displays the updated progress.

5. Module-wise Demonstration

Module	What to Show
Login / Registration	Create account, login and input validation.
Profile	Fitness goal, activity level and preferences.
Workout Planner	Recommended workout routine.
Exercise Guide	Exercise name, instructions, duration and difficulty.
Progress Tracker	Completed workout and progress information.
Dashboard	Summary of goals, activities and progress.

6. AI / Recommendation Demonstration

During the demonstration, explain that the recommendation component uses user-provided fitness information such as goals, activity level and available workout time to select or generate suitable fitness suggestions. The exact AI model or API used should be explained according to the implementation of the project.

7. Input and Output

Input: User profile, fitness goal, activity level, preferences and workout information.

Processing: Application logic and recommendation component analyze the input.

Output: Workout suggestions, exercise details and progress information.

8. Testing During Demonstration

- Test valid and invalid login details.
- Check whether profile information is stored correctly.
- Verify that workout recommendations are displayed.
- Check workout completion and progress recording.
- Test the application on different screen sizes.

9. Expected Demonstration Result

The demonstration should show that FitBuddy can guide a user from profile creation to workout selection and progress tracking through a clear and simple interface. All major implemented modules should work together as one application.

10. Demonstration Checklist

- Project/application opens successfully.
- All main pages are accessible.
- Sample user data is ready.
- Workout recommendation feature is ready.
- Progress tracking is ready.

- Database/API connection is working, if implemented.
- Presentation/demo explanation is prepared.

11. Conclusion

The FitBuddy project demonstration presents the working concept and major features of an AI-powered fitness and wellness assistant. It demonstrates how user information can be used to provide personalized fitness guidance and track progress through a single application.

Note: FitBuddy provides general fitness and wellness information and should not be treated as a substitute for professional medical advice.
